CONTENTS

INTRODUCTION

1. Loan-Prediction – It is the process by which a machine learning algorithm can predict whether a person will get loan or not.

2. Understanding the problem statement is the first and foremost step. This would help you give an intuition of what you will face ahead of time. Let us see the problem statement.

3. Dream Housing Finance company deals in all home loans. They have presence across all urban, semi urban and rural areas. Customer first apply for home loan after that company validates the customer eligibility for loan. Company wants to automate the loan eligibility process (real time) based on customer detail provided while filling online application form. These details are Gender, Marital Status, Education, Number of Dependents, Income, Loan Amount, Credit History and others. To automate this process, they have given a problem to identify the customer segments, those are eligible for loan amount so that they can specifically target these customers.

4. It is a classification problem where we have to predict whether a loan would be approved or not. In a classification problem, we have to predict discrete values based on a given set of independent variable(s). Classification can be of two types:

5. Binary Classification : In this classification we have to predict either of the two given classes. For example: classifying the gender as male or female, predicting the result as win or loss, etc. Multiclass Classification : Here we have to classify the data into three or more classes. For example: classifying a movie's genre as comedy, action or romantic, classify fruits as oranges, apples, or pears, etc.

6. Loan prediction is a very common real-life problem that each retail bank faces atleast once in its lifetime. If done correctly, it can save a lot of man hours at the end of a retail bank.

Steps involved in machine learning

1. Data Collection

- The quantity & quality of your data dictate how accurate our model is

- The outcome of this step is generally a representation of data which we will use for training
- Using pre-collected data, by way of datasets from Kaggle, UCI, etc., still fits into this step.

2. Data Preparation

- Wrangle data and prepare it for training
- Clean that which may require it (remove duplicates, correct errors, deal with missing values, normalization, data type conversions, etc.)
- Randomize data, which erases the effects of the particular order in which we collected and/or otherwise prepared our data.

3. Choose a Model

- Different algorithms are for different tasks; choose the right one

4. Train the Model

- The goal of training is to answer a question or make a prediction correctly as often as possible
- Linear regression example: algorithm would need to learn values for m (or W) and b (x is input, y is output)
- Each iteration of process is a training step.

5. Evaluate the Model

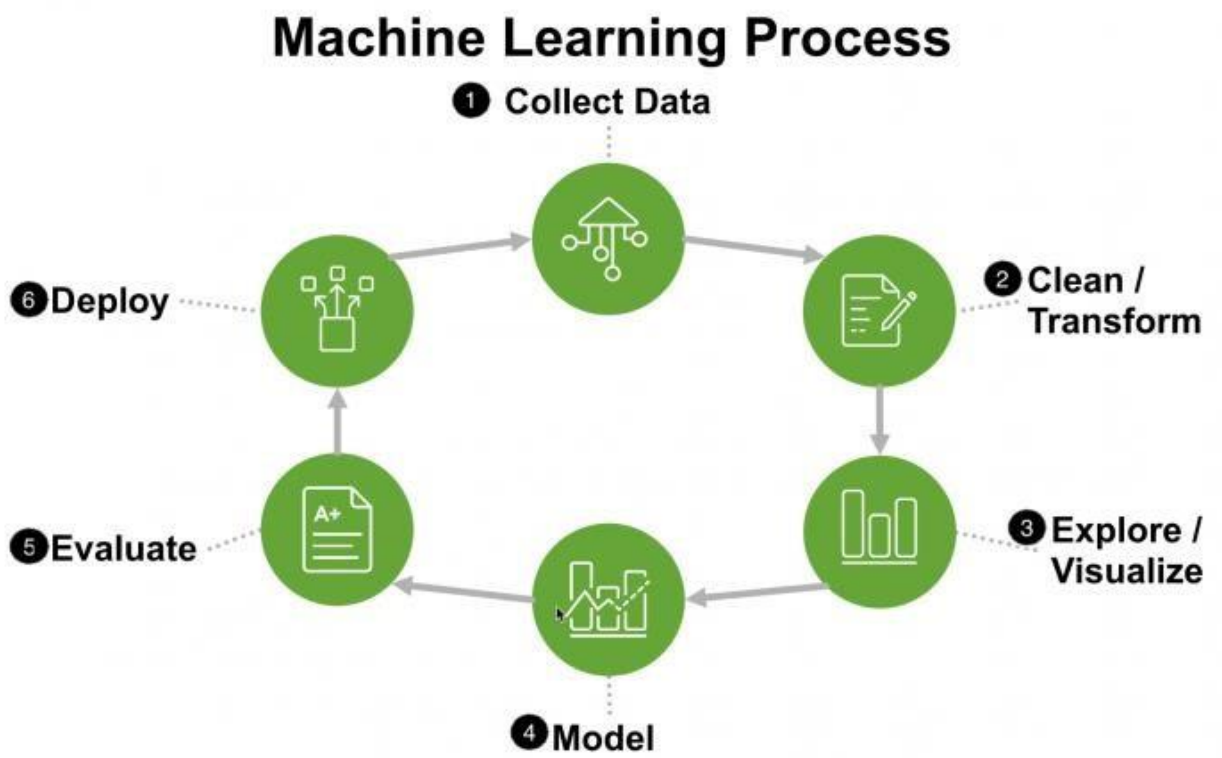
- Uses some metric or combination of metrics to "measure" objective performance of model
- Test the model against previously unseen data
- This unseen data is meant to be somewhat representative of model performance in the real world, but still helps tune the model (as opposed to test data, which does not)
- Good train/evaluate split 80/20, 70/30, or similar, depending on domain, data availability, dataset particulars, etc.

6. Parameter Tuning

- This step refers to *hyper-parameter* tuning, which is an "art form" as opposed to a science
- Tune model parameters for improved performance
- Simple model hyper-parameters may include: number of training steps, learning rate, initialization values and distribution, etc.

7. Make Predictions

- Using further (test set) data which have, until this point, been withheld from the model (and for which class labels are known), are used to test the model; a better approximation of how the model will perform in the real world.



DATASETS

- Here we have two datasets. First is train_dataset.csv, test_dataset.csv.
- These are datasets of loan approval applications which are featured with annualincome, married or not, dependents are there or not, educated or not, credit history present or not, loan amount etc.
- The outcome of the dataset is represented by loan_status in the train dataset.
- This column is absent in test_dataset.csv as we need to assign loan status with the help of training dataset.
- These two datasets are already uploaded on google colab.

FEATURES PRESENT IN LOAN PREDICTION

- Loan_ID – The ID number generated by the bank which is giving loan.
- Gender – Whether the person taking loan is male or female.
- Married – Whether the person is married or unmarried.

- Dependents – Family members who stay with the person.
- Education – Educational qualification of the person taking loan.
- Self_Employed – Whether the person is self-employed or not.
- ApplicantIncome – The basic salary or income of the applicant per month.
- CoapplicantIncome – The basic income or family members.
- LoanAmount – The amount of loan for which loan is applied.
- Loan_Amount_Term – How much time does the loan applicant take to pay the loan.
- Credit_History – Whether the loan applicant has taken loan previously from same bank.
- Property_Area – This is about the area where the person stays (Rural/Urban).

LABELS

- LOAN_STATUS – Based on the mentioned features, the machine learning algorithm decides whether the person should be give loan or not.

Visualizing data using google Colab Code and output

```
#Importing required libraries
import pandas as pd import
matplotlib.pyplot as plt import
seaborn as sns import numpy
as np from scipy.stats import
norm
from sklearn.preprocessing import StandardScaler
from scipy import stats import
warnings
warnings.filterwarnings('ignore')
%matplotlib inline

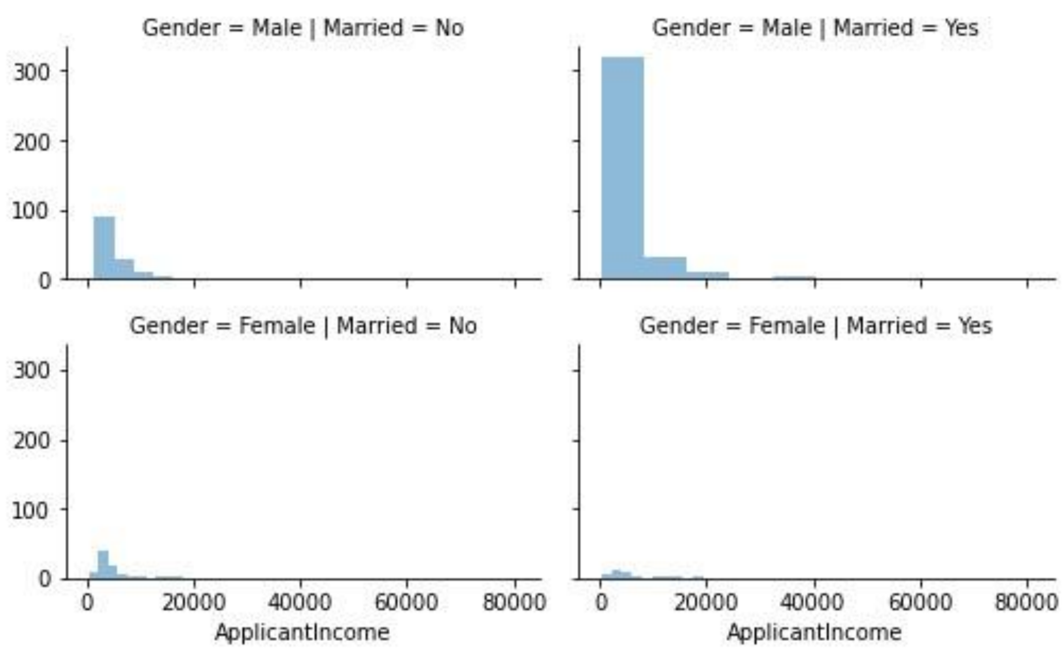
df_train = pd.read_csv('train_dataset.csv')

# take a look at the top 5 rows of the train set, notice the column "Loan_Status"
df_train.head()
```

Loan_ID	Gender	Married	Dependents	Education	Self_Employed	ApplicantIncome	CoapplicantIncome	LoanAmount	Loan_Amount_Term	Credit_History	Property_Area	Loan_Status
LP001002	Male	No	0	Graduate	No	5849	0.0	NaN	360.0	1.0	Urban	Y
LP001003	Male	Yes	1	Graduate	No	4583	1508.0	128.0	360.0	1.0	Rural	N
LP001005	Male	Yes	0	Graduate	Yes	3000	0.0	66.0	360.0	1.0	Urban	Y
LP001006	Male	Yes	0	Not Graduate	No	2583	2358.0	120.0	360.0	1.0	Urban	Y
LP001008	Male	No	0	Graduate	No	6000	0.0	141.0	360.0	1.0	Urban	Y

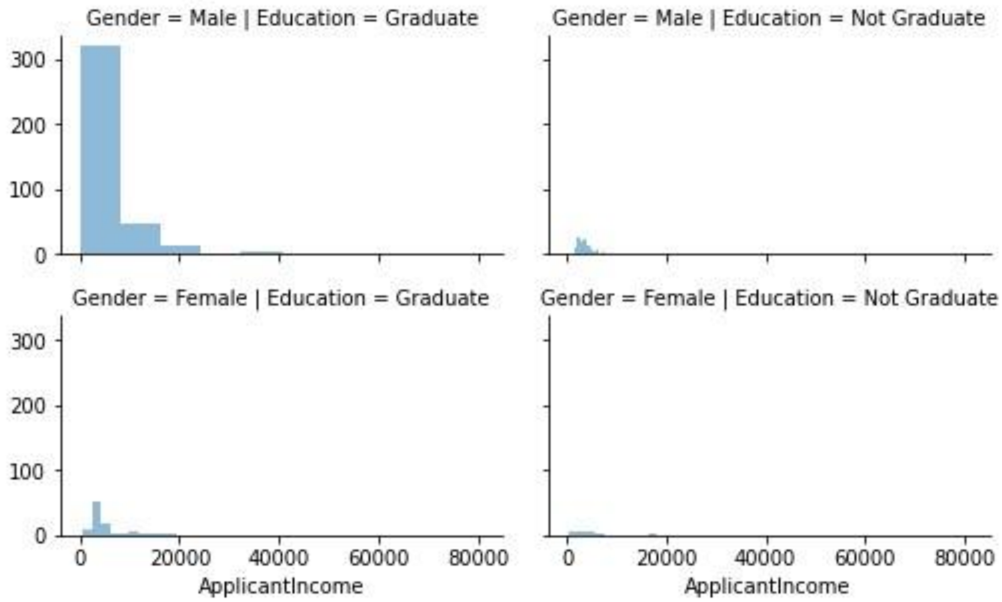
This code visualizes the people applying for loan who are categorized based on gender and marriage

```
grid = sns.FacetGrid(df_train, row='Gender', col='Married', size=2.2, aspect=1.6)
grid.map(plt.hist, 'ApplicantIncome', alpha=.5, bins=10) grid.add_legend()
```

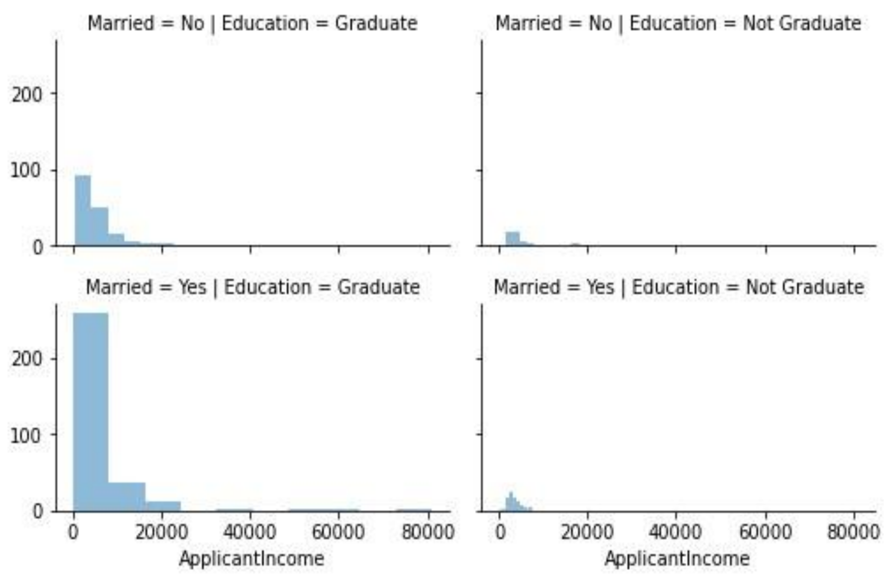


```
# Graphs plotted based on categories gender and education grid = sns.FacetGrid(df_train, row='Gender',
col='Education', size=2.2, as pect=1.6) grid.map(plt.hist, 'ApplicantIncome', alpha=.5, bins=10) grid.add_legend()
```

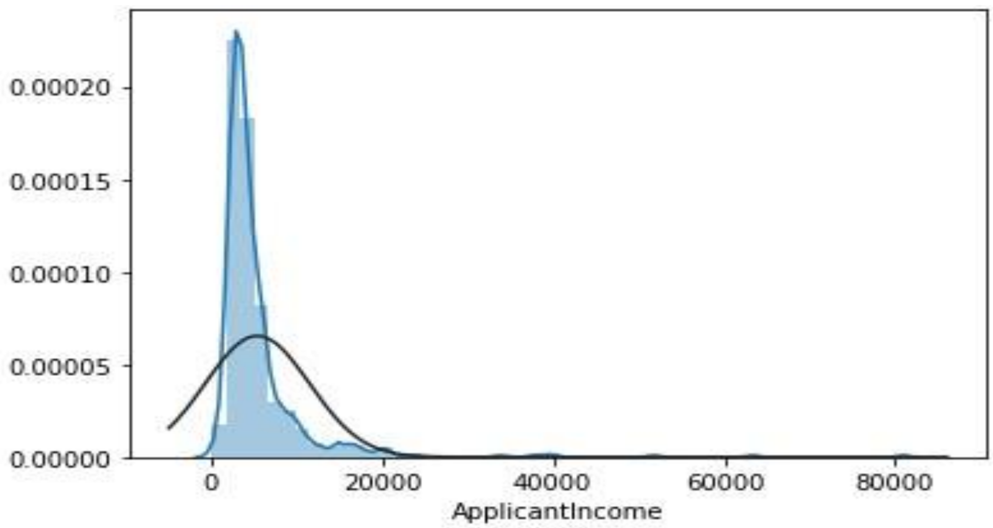
```
<seaborn.axisgrid.FacetGrid at 0x7fa17e8d9e80>
```

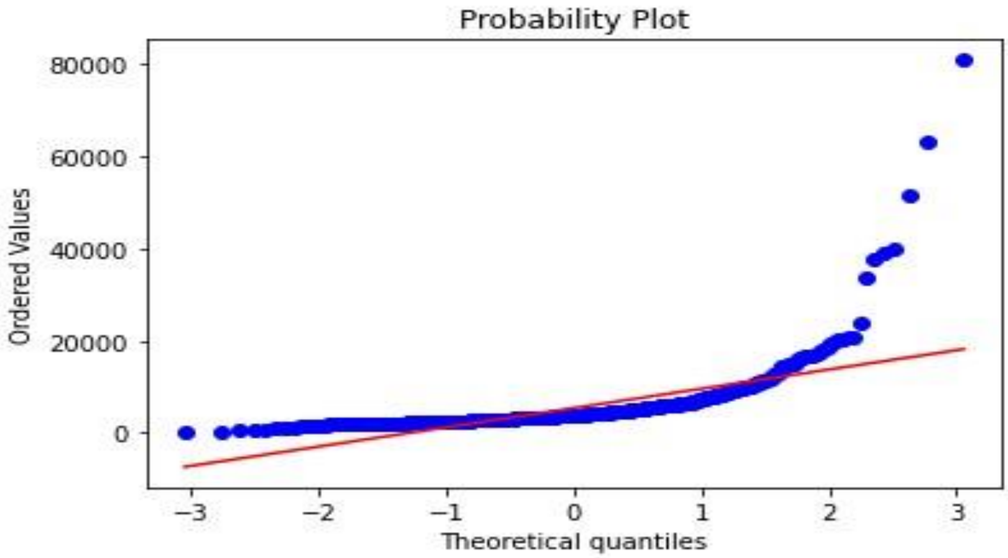


```
# Graphs plotted based on categories marriage and education grid = sns.FacetGrid(df_train, row='Married',
col='Education', size=2.2, a spect=1.6) grid.map(plt.hist, 'ApplicantIncome', alpha=.5, bins=10) grid.add_legend()
```



```
#histogram and normal probability plot
sns.distplot(df_train['ApplicantIncome'], fit=norm); fig =
plt.figure()
res = stats.probplot(df_train['ApplicantIncome'], plot=plt)
```

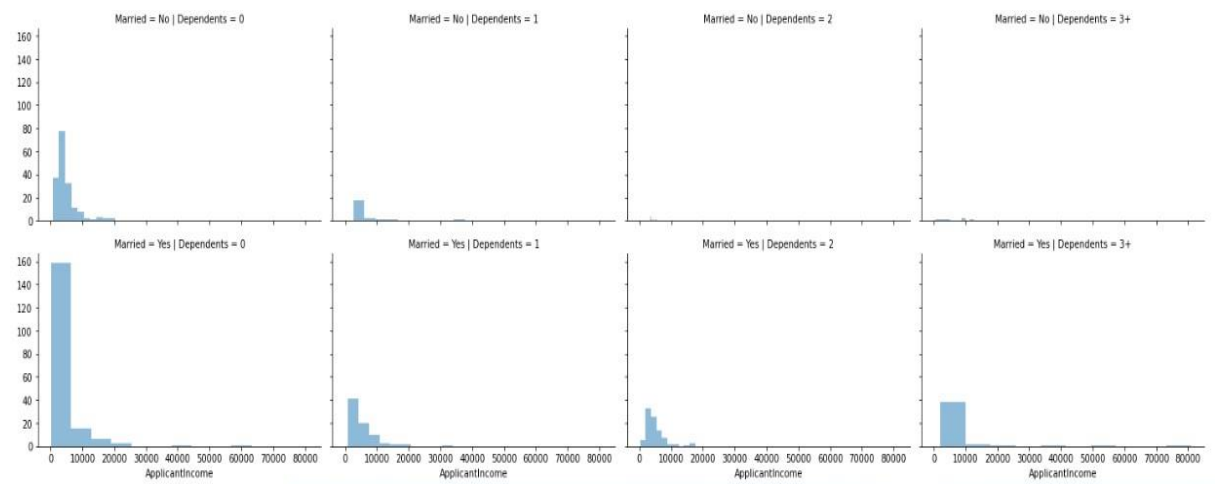




```
#correlation matrix corrmat = df_train.corr() f,
ax = plt.subplots(figsize=(12, 9))
sns.heatmap(corrmat, vmax=.8, square=True);
```

This graph depicts the combination of applicant income, married people and dependent people in a family

grid = sns.FacetGrid(df_train, row='Married', col='Dependents', size=3.2, aspect=1.6)
grid.map(plt.hist, 'ApplicantIncome', alpha=.5, bins=10) grid.add_legend()



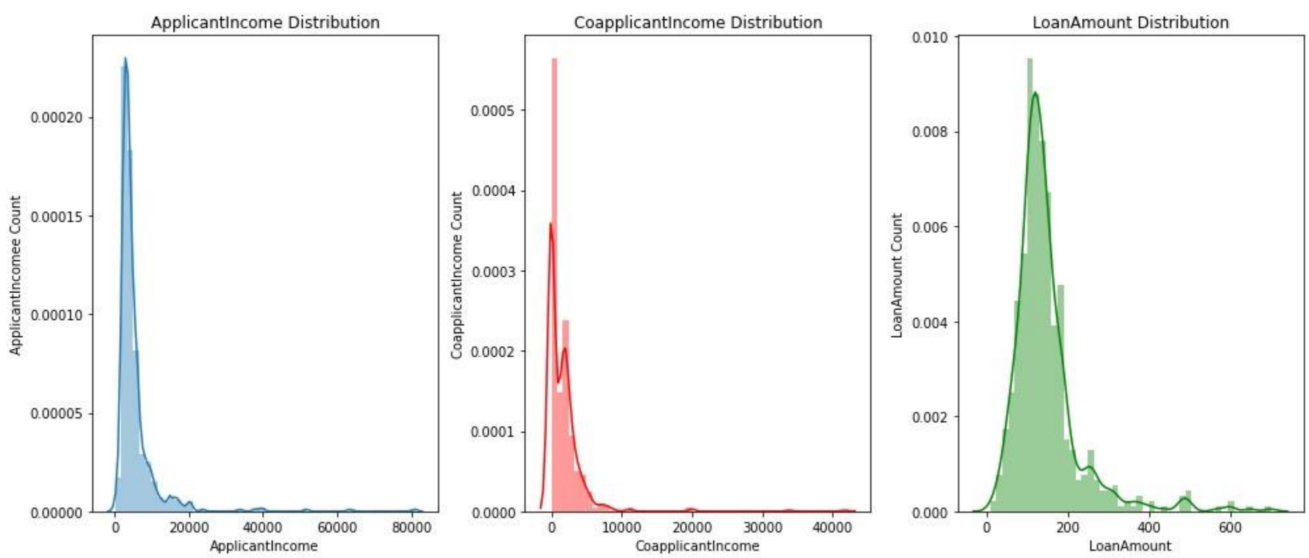
The graph which differentiates the applicant income distribution, Coapplicant income distribution, loan amount distribution

flg, axes = plt.subplots(nrows = 1, ncols = 3, figsize = (14,6))
sns.distplot(df_train['ApplicantIncome'], ax = axes[0]).set_title('ApplicantIncome Distrib ution')
axes[0].set_ylabel('ApplicantIncomee Count')

```
sns.distplot(df_train['CoapplicantIncome'], color = "r", ax = axes[1]).set_title('Coapplican
tIncome Distribution')
axes[1].set_ylabel('CoapplicantIncome Count')

sns.distplot(df_train['LoanAmount'],color = "g", ax = axes[2]).set_title('LoanAmount Dist
ribution')
axes[2].set_ylabel('LoanAmount Count')

plt.tight_layout() plt.show()
plt.gcf().clear()
```



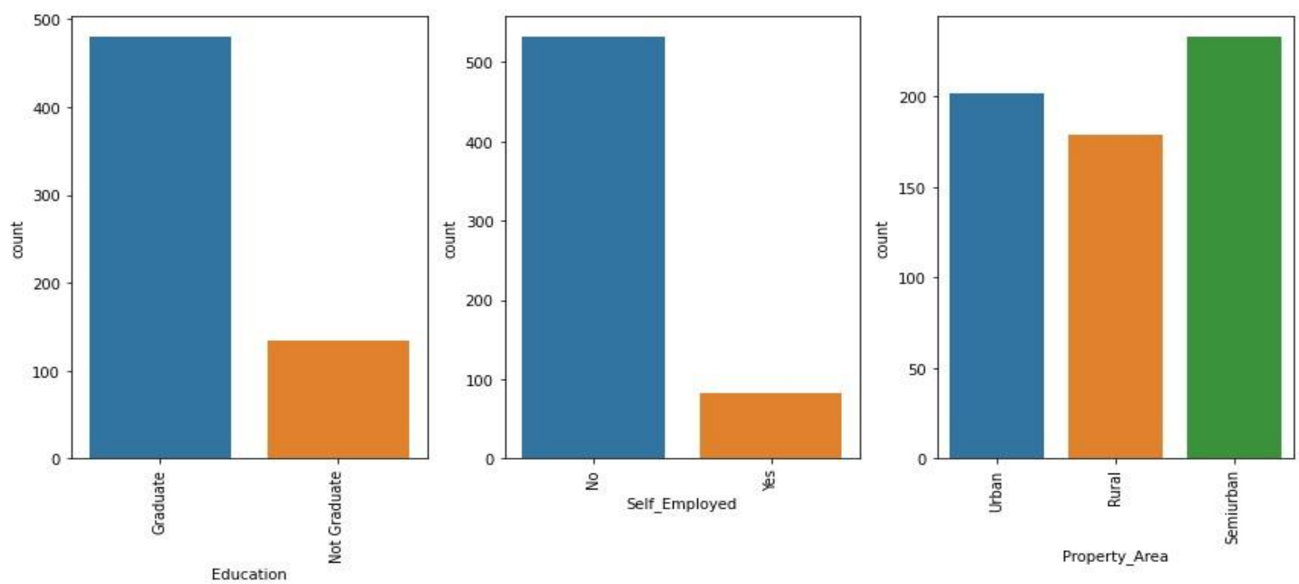
```
# This figure shows the count of people differentiated based on education, self_employed,
and property_area

fig, axes = plt.subplots(ncols=3,figsize=(12,6))

g = sns.countplot(df_train["Education"], ax=axes[0]) plt.setp(g.get_xticklabels(),
rotation=90)
```

```
g = sns.countplot(df_train["Self_Employed"], ax=axes[1]) plt.setp(g.get_xticklabels(),
rotation=90)
g = sns.countplot(df_train["Property_Area"], ax=axes[2]) plt.setp(g.get_xticklabels(),
rotation=90)

plt.tight_layout()
plt.show() plt.gcf().clear()
```



Explanation of the Main Code using Google Colab

1. Logistic Regression model

```
# Importing required Libraries import
pandas as pd
import numpy as np                  # For mathematical calculations
import seaborn as sns               # For data visualization import
matplotlib.pyplot as plt        # For plotting graphs

# Importing dataset
train = pd.read_csv('train_dataset.csv')
test = pd.read_csv('test_dataset.csv')

# Converting the values to number
```

```
train['Dependents'].replace('3+', 3,inplace=True) test['Dependents'].replace('3+',
3,inplace=True)
```

```
# take a look at the top 5 rows of the train set, notice the column "Loan_Status" train.head()
```

	Loan_ID	Gender	Married	Dependents	Education	Self_Employed	ApplicantIncome	CoapplicantIncome	LoanAmount	Loan_Amount_Term	Credit_History	Property_Area	Loan_Status

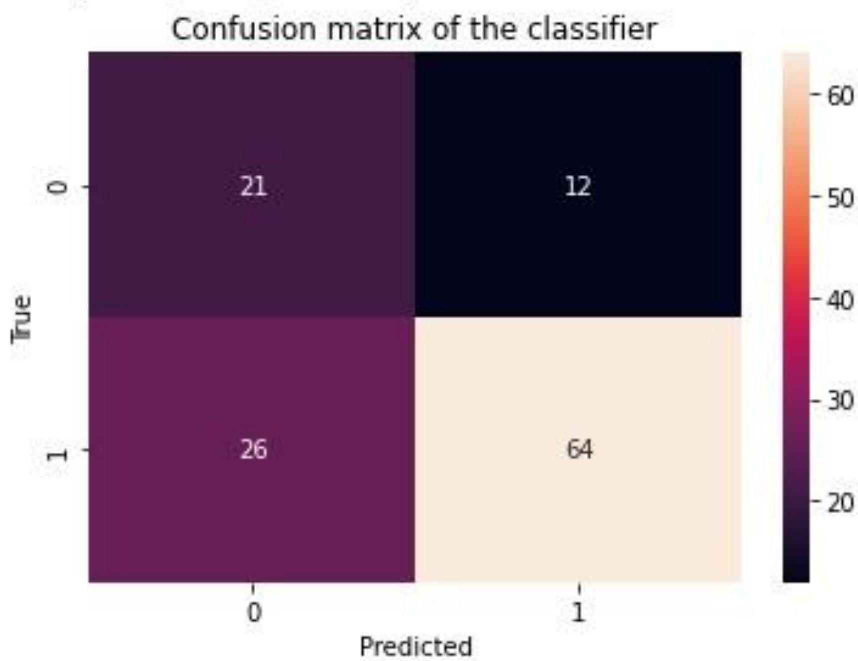
classifier') plt.xlabel('Predicted')
plt.ylabel('True')
```

```
[[21 12]
 [26 64]]
Text(33.0, 0.5, 'True')
```



```
# Check Accuracy
from sklearn.metrics import accuracy_score accuracy_score(y_test,y_pred)
```

```
0.8373983739837398
```

```
# Applying k-Fold Cross Validation
from sklearn.model_selection import cross_val_score
accuracies = cross_val_score(estimator = classifier, X = X_train, y = y_train, cv = 10)

accuracies.mean()
# accuracies.std()
```

```
0.8024081632653062
```

2. Using Random Forest Classification

The code till feature scaling is same, there onwards code is slightly different

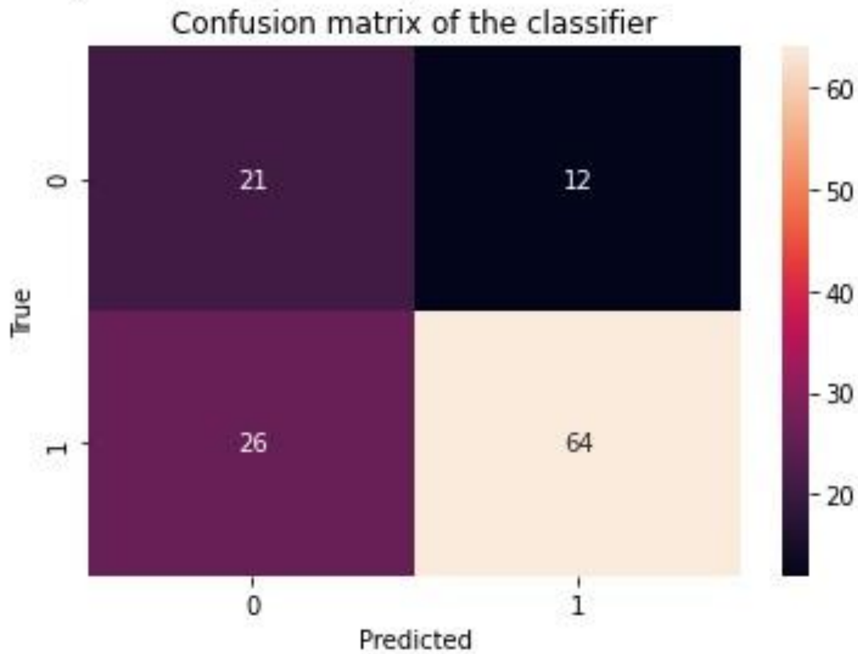
```
# Fitting Random Forest Classification to the Training set from sklearn.tree
import DecisionTreeClassifier classifier =
DecisionTreeClassifier(criterion="entropy", random_state=0)
classifier.fit(X_train,y_train)

# Printing values of whether loan is accepted or rejected
y_pred[:100]
```

```
array(['N', 'Y', 'Y', 'N', 'Y', 'N', 'N', 'Y', 'N', 'Y', 'Y', 'Y', 'Y',
       'Y', 'Y', 'Y', 'Y', 'N', 'N', 'N', 'N', 'Y', 'Y', 'Y', 'N', 'Y',
       'N', 'Y', 'N', 'N', 'Y', 'N', 'Y', 'N', 'N', 'N', 'Y', 'Y', 'Y',
       'Y', 'N', 'N', 'Y', 'Y', 'Y', 'N', 'Y', 'Y', 'N', 'Y', 'Y', 'Y',
       'Y', 'Y', 'Y', 'N', 'Y', 'N', 'Y', 'Y', 'N', 'Y', 'Y', 'N', 'Y',
       'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'N', 'Y', 'Y', 'Y', 'N', 'N',
       'N', 'N', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'N', 'Y', 'Y', 'N',
       'Y', 'Y', 'N', 'N', 'N', 'Y', 'Y', 'Y', 'N'], dtype=object)
```

```
#confusion matrix
```

```
[[21 12]
 [26 64]]
Text(33.0, 0.5, 'True')
```



```
# Check Accuracy
from sklearn.metrics import accuracy_score accuracy_score(y_test,y_pred)
```

0.6910569105691057

```
# Applying k-Fold Cross Validation
from sklearn.model_selection import cross_val_score
accuracies = cross_val_score(estimator = classifier, X = X_train, y = y_train, cv = 10)

accuracies.mean()
# accuracies.std()
```

0.7148163265306122

3. Using Decision Tree Classifiaction Model

# Fitting Decision Tree Classification to the Training set from sklearn.naive_bayes import GaussianNB
classifier = GaussianNB() classifier.fit(X_train,y_train)

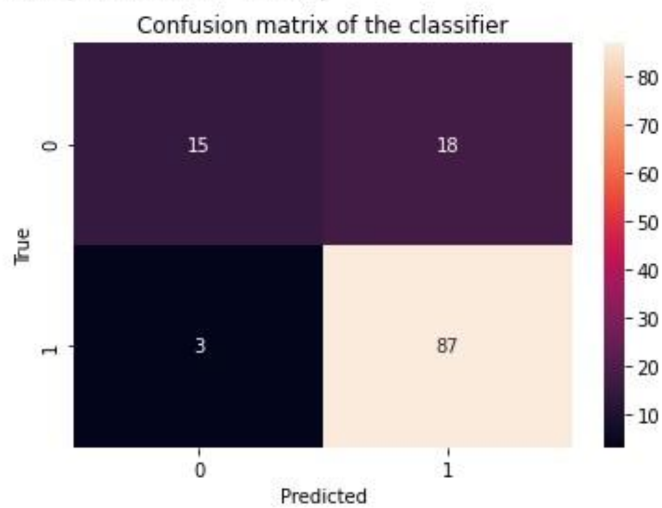
# Predecting the results
y_pred = classifier.predict(X_test)

Printing values of whether loan is accepted or rejected y_pred[:100]

```
array(['Y', 'Y', 'Y', 'Y', 'Y', 'N', 'Y', 'Y', 'N', 'Y', 'Y', 'Y', 'Y',
       'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'N', 'N', 'Y', 'Y', 'Y', 'Y', 'Y',
       'Y', 'Y', 'N', 'N', 'Y', 'Y', 'Y', 'Y', 'Y', 'N', 'Y', 'Y', 'Y',
       'Y', 'Y', 'N', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y',
       'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'N', 'Y', 'Y', 'N', 'Y',
       'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'N', 'Y',
       'Y', 'N', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'Y', 'N', 'Y', 'Y', 'Y',
       'Y', 'Y', 'N', 'Y', 'N', 'Y', 'Y', 'Y', 'Y'], dtype='<U1')
```

#confusion matrix

```
[[15 18]
 [ 3 87]]
Text(33.0, 0.5, 'True')
```



# Check Accuracy from sklearn.metrics import accuracy_score
accuracy_score(y_test,y_pred)

0.8292682926829268

```
# Applying k-Fold Cross Validation from sklearn.model_selection import cross_val_score accuracies =
cross_val_score(estimator = classifier, X = X_train, y = y_tr ain, cv = 10)
 accuracies.mean()
# accuracies.std()
```

0.7922448979591836

Loan prediction models comparison

Loan Prediction	Accuracy	Accuracy using K-fold Cross Validation
Using Logistic Regression	0.8373983739837398	0.8024081632653062
Using Random Forest Classification	0.6910569105691057	0.7148163265306122
Using Decision Tree Classification	0.8292682926829268	0.7922448979591836

SUMMARY

The task of this machine learning project is to train the model for accepting loan or rejecting loan. Now there are 3 models wherein we can train the model and test it to predict whether other applicants could get loan or not. First model is about using logistic regression model for which the accuracy is 0.8373 and accuracy using k-fold cross validation comes to 0.8024. Second model gives 0.6910 accuracy and 0.7148 accuracy using k-fold cross validation. Third model gives 0.8292 and 0.7922 as accuracies. Among all the models, Logistic regression gives better accuracy. This Logistic regression model has been trained with a datasets and tested with another dataset.
